You might have noticed that methods like insert, remove or sort that only modify the list have no return value printed - they return the default None. 1 This is a design principle for all mutable data structures in Python.. Another thing you might notice is that not all data can be sorted or compared. For instance, [None, 'hello', 10] doesn't sort because integers can't be compared to ...

The data structure is not any programming language like C, C++, java, etc. It is a set of algorithms that we can use in any programming language to structure the data in the memory. To structure the data in memory, 'n' number of algorithms were proposed, and all these algorithms are known as Abstract data types.
