We introduce an immersed meshfree formulation for modeling heterogeneous materials with flexible non-body-fitted discretizations, approximations, and quadrature rules. The interfacial compatibility condition is imposed by a volumetric constraint, which avoids a tedious contour integral for complex material geometry. The proposed immersed approach is formulated under a variational multiscale ...

Modeling Heat Transfer, Convection, and  
Reradiation Within and Around a  
Material. You can use any of the  
previous five approaches to model the  
power deposition from a laser source in  
a solid material. Modeling the  
temperature rise and heat flux within  
and around the material additionally  
requires the Heat Transfer in Solids  
interface.
